

JAVASCRIPT FUNCTIONS - INTRODUCTION

1. What Are JavaScript Functions in n8n?

JavaScript functions are small, reusable blocks of code designed to perform a specific task.

- You give them input → They perform some operations → They return an output

2. Why Are They Useful in n8n?

In n8n, JavaScript functions allow you to:

- Go **beyond** what standard nodes can do
- Transform incoming data
- Calculate custom values
- Filter results **dynamically**
- Create new data from scratch

JAVASCRIPT FUNCTIONS - INTRODUCTION

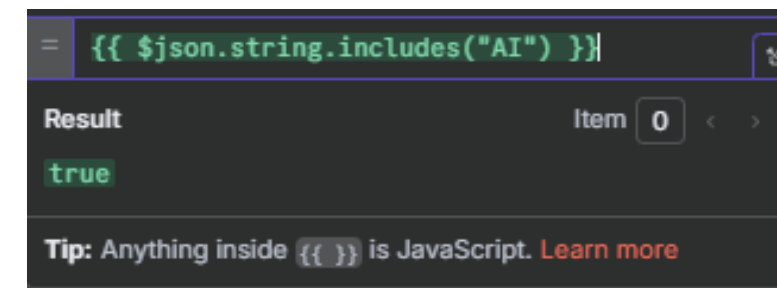

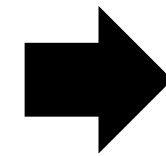

3. Key Benefit

Think of a JavaScript function in n8n as your custom automation tool. It works inside your workflow, takes the data flowing through it, processes it however you want, and sends the modified result to the next step - **giving you full flexibility over your automation.**

4. Example Use Cases

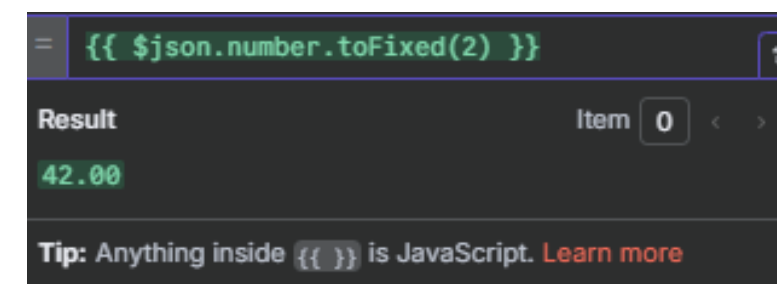

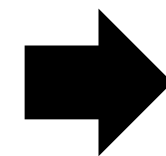

4.1) Check if string contains a word → **{{ \$json.string.includes("AI") }}**

- **What it does:** Checks if a string contains the word "AI".
- **Use case:** Trigger an automation only if a message mentions AI.

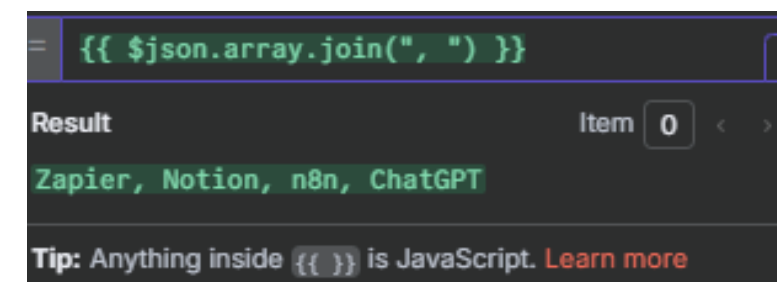

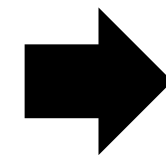

4.2) Round number to 2 decimals → **{{ \$json.number.toFixed(2) }}**

- **What it does:** Rounds a number to two decimal places.
- **Use case:** Format prices before adding them to an invoice.

4.3) Join array into a string → **{{ \$json.array.join(", ") }}**

- **What it does:** Combines array items into one string separated by commas.
- **Use case:** Turn a list of tags into a single field for a CRM.

5. Notes for Using Functions

- **You won't use most of these functions daily** – but it's valuable to know them. In specific situations, the right function can save you time and simplify complex steps.
- **Think of functions as tools in a toolbox** – you might not need them all the time, but when the situation calls for it, you'll be glad you know they exist.
- **We will cover almost all functions** – but we may skip a few since there are many available. If we skip some, that's completely normal and won't limit your ability to work in n8n.
- **Experiment in a safe workflow** – try these snippets in a test n8n workflow so you can see what they return before using them in production.
- **Combine functions for powerful results** – often, using two or three functions together can solve tasks that would otherwise need extra nodes.
- **Check your data type first** – make sure you're applying a function to the right kind of data (string, number, array, etc.), otherwise you might get errors.
- **The key is knowing what's possible** – you don't need to memorize every syntax, but remember that n8n allows you to use JavaScript to transform data however you need.
