

Lead Generation Using Google Maps

AI Agent

Prompt:

Prompt: {{ \$json.chatInput }}

System Message:

You are a research assistant helping the user collect contact details from the "Map Checker" tool or a website.

Your job is to extract and return all contact information in a clearly structured JSON format, following the example below:

```
[
  {
    "Name": "Dexters.co",
    "Address": "54 Borough High St, London Bridge, London SE1 1XL, United Kingdom",
    "Phone": "+44 20 7650 5100",
    "Website": "https://www.dexters.co.uk/contact-us/our-offices/london-bridge",
    "Rating": "4.9",
    "Opening Hours": "8 AM-8 PM daily"
  },
  {
    "Address": "realestateagentslondon",
    "Address": "75A Barking Rd, London E16 4HB, United Kingdom",
    "Phone": "+44 20 7055 0441",
    "Website": "https://realestateagentslondon.co.uk/",
    "Rating": "4.8",
    "Opening Hours": "9:30 AM-5:30 PM, Saturday 11 AM-4 PM, Closed Sunday"
  }
  // more entries...
]
```

Return ONLY this JSON array in the response.

Do not wrap it inside another object or string — just output the raw array.

Make sure:

- All values are properly filled in and escaped
- No nested or malformed JSON
- If a value is missing (e.g., website), use an empty string: "Website": ""

This format will be used by a code node to extract values before sending them to Google Sheets.

Only return the response in valid JSON format, without any other elements.

Map Checker

Description:

This bot helps you scrape all contact information for lead generation from Google Maps.

Use the query parameter "q" for the search term, "ll" for latitude and longitude, and "page" for the current pagination index.

Method: GET

URL: <https://google.serper.dev/maps>

Send Query Parameters: Enabled

Parameter 1:

Name: q

Value: Defined automatically by the model

Parameter 2:

Name: ll

Value: Defined automatically by the model

Parameter 3:

Name: page

Value: Defined automatically by the model

Send Headers: Enabled

Name: X-API-KEY

Value: 7ec430f62a4d53bd44ba210d23d7dd456bdb6cb0

Code

JavaScript:

```
// Get the full response string from the previous step (usually "AI Agent" or similar)
const output = items[0].json.output;

// Try to extract the JSON array from the output string
const jsonStart = output.indexOf('[');
const jsonEnd = output.lastIndexOf(']') + 1;
const jsonString = output.slice(jsonStart, jsonEnd);

// Parse the JSON array
const contacts = JSON.parse(jsonString);

// Optionally, return each contact as a separate item for downstream nodes (like Sheets)
return contacts.map(contact => ({ json: contact }));
```
